

## Screenshot 4: Validation Ledger Showing Completed Lifecycle

### Suggested Caption:

*"Screenshot from the Mint-to Validation Ledger showing successful credential validation and lifecycle completion for Jane Smith. Entry #6 confirms the unit was validated and burned on April 16, 2025, at 11:20 PM. This completes the full behavioral logic lifecycle (Mint → Validate → Burn), providing timestamped evidence of the system's reflex enforcement capabilities."*

---

### Why This Matters:

-  Confirms the **burn event** was successfully executed
  -  Shows **traceable identity and timestamps**
  -  Establishes **April 16, 2025** as the date your system completed its first full cycle
  -  Reinforces that this wasn't theoretical — it was a **functional, validated process**
- 

### Optional Notes You Can Include Elsewhere:

*"Additional validation records post-May 1 were deleted for security purposes. However, metadata from the platform can be retrieved to reverify their timestamps if needed. All core pilot data remains intact to prove the original cycle's execution and behavioral enforcement."*

---

### Summary of All Four Screenshots

If you put this into a single slide or PDF:

1. **Screenshot 1** – Make.com workflows w/ April 16 start
2. **Screenshot 2** – Tally form submissions (real data entries)

3. **Screenshot 3** – Public-facing credential input form (Tally URL)
4. **Screenshot 4** – Ledger showing lifecycle: validated → burned on 4/16
